DETAILED ACTION

Claim Objections

1. The numbering of claims is not in accordance with 37 CFR 1.126 which requires the original numbering of the claims to be preserved throughout the prosecution. When claims are canceled, the remaining claims must not be renumbered. When new claims are presented, they must be numbered consecutively beginning with the number next following the highest numbered claims previously presented (whether entered or not).

Misnumbered claims 1-14 have been renumbered 84-97 respectively. *Claim Rejections -*

35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claim 94 is rejected under 35 U.S.C. 102(b) as being anticipated by US Patent 4,980,897 (hereinafter referred as “Decker”).

Decker discloses the invention (claim 94) as claimed including a process for Trellis encoding a plurality of payload bits into a constellation point, comprising:

- (a) receiving a plurality of payload bits (see Figs. 4 and 6, col. 5, lines 50-53). Wherein Trellis Encoder receives payload bits X_m - X_{k+1} and X_k - X_1 ;
- (b) convolutionally encoding a combination of said payload bits into one or more additional bits by applying said payload bits to different inputs of a convolutional encoder (see Fig. 6, element 93, col. 6, lines 17-20, wherein convolutional encoder 93 encodes X_2 - X_1) and also

Art Unit: 2661

applying a modified bit to an input of said convolutional encoder, said modified bit being generated by exclusive-ORing one of said payload bits with an output bit from an intermediate stage of said convolutional encoder, said convolutional encoding step resulting in output of one or more additional bits (see Fig. 6, col. 6, lines 22-29, 65-67, wherein XOR generated the modified bits in convolutional encoder 93 at the input of convolutional encoder);

(c) mapping the combination of at least some of said payload bits in an unmodified state, said modified bit and said one or more additional bits into a constellation point (see Figs. 4 and 6, elements X_m - X_3 , Z_2 - Z_0 , and 72, col. 6, lines 57-61, wherein the unmodified bits X_m - X_3 and modified Z_2 - Z_0 are mapped into 72).

Allowable Subject Matter

4. Claims 84-93 are allowed.

5. Claims 95-97 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

(1) US Patent 5,953,376 (Wei) discloses probabilistic trellis coded modulation with PCM-derived constellations.

(2) US Patent 5,774,500 (Zogakis et al) discloses mutli-channel trellis shaper.

(3) US Patent 5,621,761 (Heegard) discloses rotationally invariant Trellis coding incorporating transparent binary convolutional codes.

Art Unit: 2661

(4) US Patent 5,757,856 (Fang) discloses differential coder decoder for pragmatic approach Trellis coded 8-PSK modulation.
